

Data Analytics Internship — Level 1

Task 2: City Analysis

Objective

This report analyzes a global restaurant dataset at the city level. It identifies which city has the highest number of restaurants, calculates the average customer rating for restaurants in each city, and determines which city has the highest average rating — directly addressing the Level 1, Task 2 brief.

Dataset Overview

Metric	Value
Total restaurant records	9,551
Distinct cities covered	141
Overall average rating (all restaurants)	2.67 / 5
Restaurants with no rating (0.0, excluded from rating analysis)	2,148

1. City with the Highest Number of Restaurants

New Delhi has the most restaurants in the dataset, with **5,473** listings — far ahead of any other city.

Top 10 Cities by Number of Restaurants

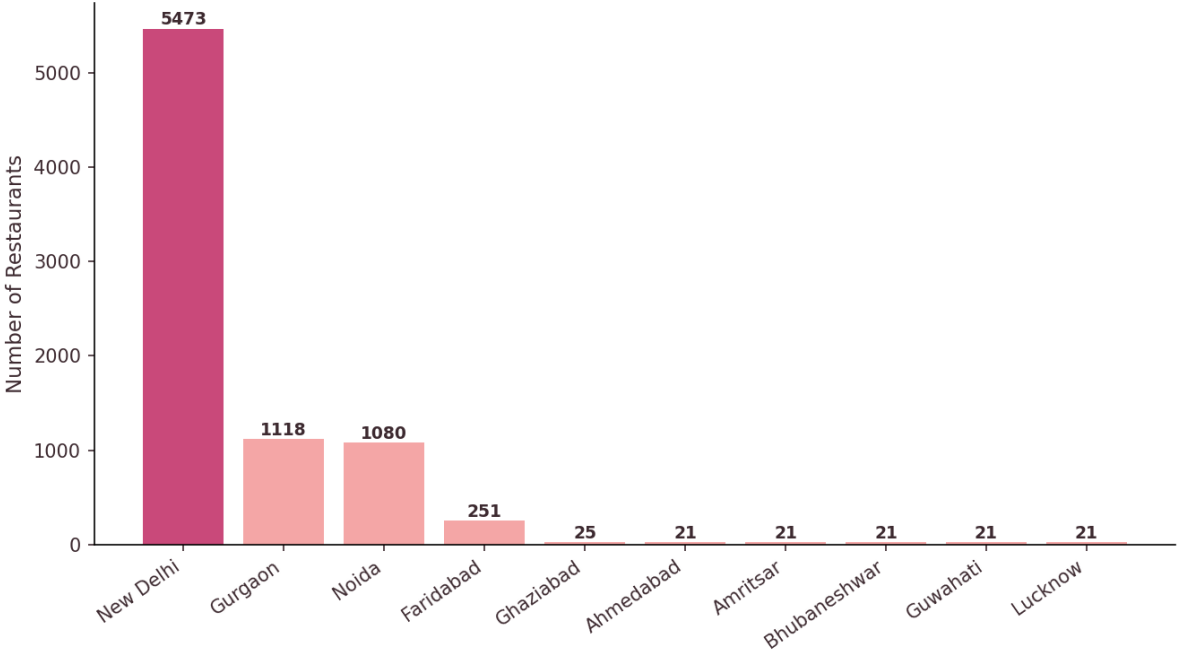

Figure 1: Top 10 cities ranked by number of restaurant listings.

2. Average Rating by City

Average ratings were calculated per city using only restaurants that have received at least one customer rating (2,148 restaurants with a rating of 0.0, meaning 'not yet rated', were excluded so they don't distort the averages). Many cities in the dataset have only 1–4 rated restaurants, which can produce misleadingly high or low averages. To keep the ranking meaningful, the table and chart below focus on cities with at least 5 rated restaurants.

Rank	City	Avg Rating	Rated Restaurants
1	London	4.54	20
2	Rio de Janeiro	4.49	19
3	Orlando	4.47	20
4	Tampa Bay	4.41	20
5	Rest of Hawaii	4.41	20
6	Bangalore	4.38	20
7	Dubai	4.37	20
8	Jakarta	4.36	16
9	Hyderabad	4.34	18
10	Chennai	4.31	20

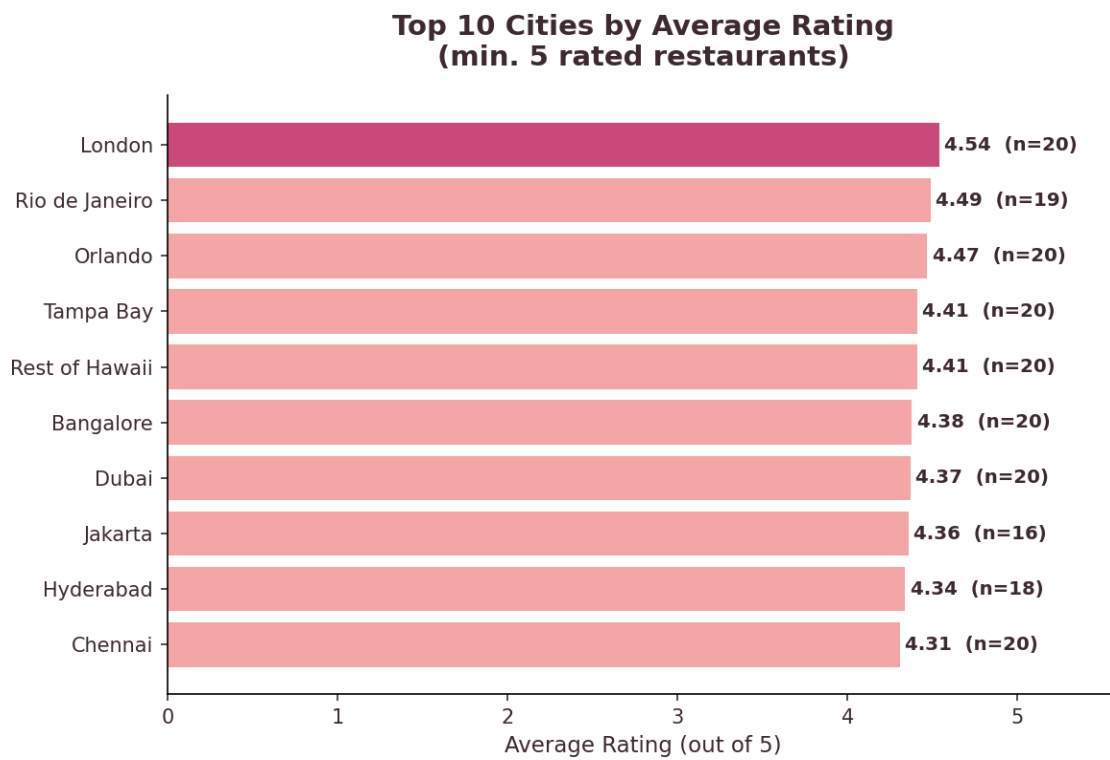

Figure 2: Top 10 cities by average rating (minimum 5 rated restaurants).

3. City with the Highest Average Rating

Among cities with a meaningful sample of rated restaurants (5 or more), **London** has the highest average rating at **4.54 / 5**, based on 20 rated restaurants.

Note on raw (unfiltered) results: If every city is considered regardless of sample size, 'Inner City' technically shows the single highest average rating (4.9/5), but this is based on just 1–2 restaurants and is not statistically reliable. For a trustworthy answer to 'which city rates best', the filtered result above (London) is the recommended finding.

Conclusion

New Delhi dominates the dataset by sheer restaurant volume, reflecting its status as a major metropolitan food market, while cities like London, Rio de Janeiro, and Orlando stand out for consistently higher customer satisfaction. This distinction between 'most restaurants' and 'best-rated restaurants' highlights that market size and customer satisfaction are independent dimensions worth tracking separately when evaluating city-level restaurant performance.
