

Data Analytics Internship — Level 1

Task 4: Online Delivery

Objective

This report determines what share of restaurants in the dataset offer online delivery, and compares average customer ratings between restaurants that do and don't offer it — directly addressing the Level 1, Task 4 brief.

Dataset Overview

Metric	Value
Total restaurant records	9,551
Restaurants offering online delivery	2,451
Restaurants without online delivery	7,100

1. Percentage of Restaurants Offering Online Delivery

25.66% of restaurants (2,451 out of 9,551) offer online delivery, while the remaining **74.34%** (7,100) do not.

Restaurants Offering Online Delivery

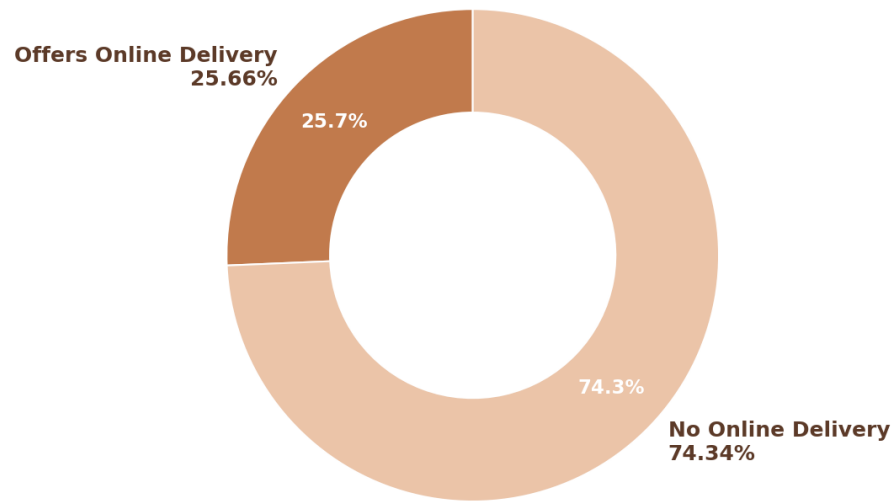

Figure 1: Share of restaurants offering online delivery.

2. Average Ratings: With vs. Without Delivery

To compare ratings fairly, unrated restaurants (rating of 0.0, meaning 'not yet rated') were excluded, since they would artificially pull down whichever group contains more of them. The comparison below uses only restaurants that have received at least one customer rating.

Among rated restaurants, those **without** online delivery actually have a slightly **higher** average rating (**3.47/5** from 5,048 restaurants) than those **with** online delivery (**3.38/5** from 2,355 restaurants). The gap is small (0.09 points).

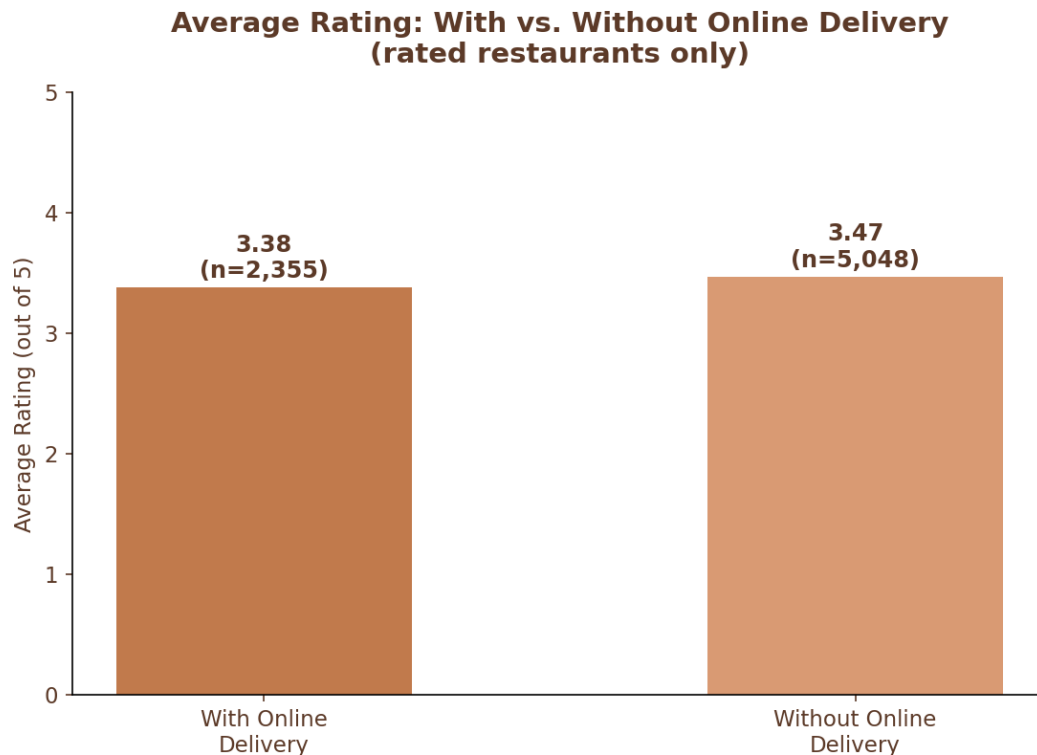

Figure 2: Average rating comparison, restaurants with vs. without online delivery (rated only).

Note on unfiltered results: If unrated restaurants are included, the picture flips — restaurants with delivery average 3.25/5 versus just 2.47/5 without delivery. This is misleading, though: a much larger share of no-delivery restaurants simply have no rating yet, which drags that average down artificially. The rated-only comparison above is the more reliable finding.

Conclusion

Online delivery is offered by roughly one in four restaurants in this dataset. Contrary to the assumption that delivery-enabled restaurants perform better, customer ratings are essentially comparable between the two groups once unrated restaurants are excluded — with restaurants lacking delivery rating marginally higher. This suggests that offering online delivery is not, on its own, a strong driver of customer satisfaction; food

quality and service likely matter more than delivery availability.
