

Data Analytics Internship — Level 3

Task 2: Votes Analysis

Objective

This report identifies the restaurants with the highest and lowest number of votes in the dataset, and analyzes whether a correlation exists between vote count and restaurant rating — addressing the Level 3, Task 2 brief.

Dataset Overview

Metric	Value
Total restaurant records	9,551
Maximum votes recorded	10,934
Restaurants with zero votes	1,094

1. Highest & Lowest Voted Restaurants

Highest votes: "Toit" in Bangalore leads with **10,934 votes** and a rating of 4.8/5.

Lowest votes: 1,094 restaurants are tied at the minimum with **0 votes** — these have not yet received any customer votes, so there is no single "lowest" restaurant to name; it's a shared minimum across over 1,000 listings.

Figure 1: Top 5 restaurants ranked by number of votes.

Rank	Restaurant	City	Votes	Rating
1	Toit	Bangalore	10,934	4.8
2	Truffles	Bangalore	9,667	4.7
3	Hauz Khas Social	New Delhi	7,931	4.3
4	Peter Cat	Kolkata	7,574	4.3
5	AB's - Absolute Barbecues	Bangalore	6,907	4.6

2. Correlation Between Votes and Rating

Across all restaurants, votes and rating show a positive correlation ($r = 0.314$). When restricted to restaurants that have both votes and a rating (excluding zero-vote/unrated listings), the correlation strengthens to $r = 0.409$ — a moderate positive relationship. This means restaurants with more votes tend to have somewhat higher ratings, though the relationship is far from perfect (many other factors influence rating).

Figure 2: Average rating climbs steadily as vote-count range increases.

Figure 3: Scatter of votes (log scale) vs. rating for restaurants with at least one vote and rating.

Conclusion

Vote count and rating are moderately positively correlated: restaurants that attract more customer engagement (votes) also tend to be rated more favorably, with average rating climbing from near 0 for unvoted restaurants to above 4.4 for restaurants with 5,000+ votes. This likely reflects a feedback loop where well-regarded restaurants attract more customers and, in turn, more votes — rather than votes themselves causing higher ratings.
